

The background of the slide features a dark, futuristic aesthetic. A smartphone is shown at an angle, its screen displaying a complex interface. The interface includes a network of glowing nodes connected by lines, suggesting a social or data network. Overlaid on this is a line graph with a green and blue line that trends upwards, indicating growth or positive performance. The overall color palette is dominated by dark blues, purples, and greens, with bright highlights from the screen's glow.

JUSTIFY

Multi-Chain Social Prediction-Market Protocol

"Trade Smarter, Together" – Unifying liquidity and social discovery across Arc, Base, Ethereum, Polygon, and BSC.

DOCUMENT SOURCE

justify-whitepaper.md // v1.0 draft

2026-06-12

CLASSIFICATION

CONFIDENTIAL // INVESTOR DECK

Protocol ID: JST-001-ALPHA

THE PROBLEM: STRUCTURAL FAILURES

SECTION 02 // MARKET ANALYSIS

BROKEN DISCOVERY

- > Markets live on **exchange-style listing pages**, disconnected from the conversations that create demand.
- > Platform gap: People debating an event and people trading it reside on **separate platforms**.

FRAGMENTED LIQUIDITY

- > Chain silos: Markets on one network are **invisible to capital** on every other network.
- > Liquidity is split into **shallow, divergent pools**, preventing efficient price discovery.

GATEKEPT CREATION

- > Market listing is an **editorial decision** made by platforms rather than a social act.
- > Creators lack the tools to launch markets around their own **native content and audiences**.

THESIS RESULT

Prediction markets are currently the most direct mechanism for pricing beliefs, yet they remain niche due to these **structural isolation barriers** between social engagement, capital, and tooling.

THE SOCIAL OBJECT

Collapsing the distance between
talking about the future and pricing it.

Markets as Social Content

Embedded interactive cards transform markets into shareable social objects. Distribution is driven by the social graph, not exchange listings.

Chain as Deployment Detail

Blockchain networks are configuration parameters, not hard dependencies. The protocol deploys natively to any EVM chain with identical logic.

Live Odds as Social Signal

Real-time market probabilities serve as collective belief indicators within discussions, allowing users to trade in two clicks without leaving the feed.

PRODUCT OVERVIEW AND USER EXPERIENCE

SECTION 04 // USER FLOW & INTERFACE

01

Sign In

Social identity or Web3 crypto wallet.

02

Scroll Feed

Discover markets from followed creators.

03

Inline Trade

Two-click execution directly in timeline.

04

Deep Dive

Full trading page with charts & discussion.

05

Portfolio

Track multi-chain positions and P&L.

06

Socialize

Engage via likes, comments, and follows.

07

Create

Submit markets with oracle proofs.

The Market as Social Object

Flippable Market Cards

Signature UI component that flips from a post to a mini order form without leaving the feed.

Live Odds Signaling

Real-time probability gauges serve as "truth signals" embedded in every social conversation.

Will ETH hit \$4k by Aug?

65% Chance

BUY YES

BUY NO

Aggregated Experience

Unified Portfolio

A single view of all held positions across Arc, Base, Ethereum, Polygon, and BSC.

Reputation Layer

Profiles highlight forecasting track records, turning accurate traders into platform influencers.

Contextual Discussion

Every market has its own thread, merging high-signal trading with high-engagement social debate.

TOTAL PORTFOLIO VALUE

\$12,450.00

FORECASTING RANK

Top 2%

SERVING TRADERS, CREATORS, AND SPECTATORS

SECTION 05 // AUDIENCE VALUE PROPOSITIONS

Traders & Forecasters

EFFICIENCY & DISCOVERY

- > Feed-driven discovery: Markets find you through your social graph.
- > Two-click execution: Trade directly from the timeline without context switching.
- > Multi-chain utility: Trade on whichever chain your capital currently resides.

KEY METRIC TRACKING

Real-time P&L and portfolio aggregation across all supported EVM networks.

Creators & Influencers

MONETIZATION & REPUTATION

- > Markets as content: Launch interactive prediction cards around your latest posts.
- > Creator incentives: Earn a share of protocol fees generated by your audience.
- > Reputation accrual: Build a track record for accurate forecasting and market curation.

ENGAGEMENT LOOP

Transform passive viewers into active participants in your ecosystem.

Spectators & Community

SOCIAL SIGNALS & DEBATE

- > Live probability: View real-time odds ("21% chance") as a signal for social sentiment.
- > Contextual debate: Discuss market outcomes in the same thread where they are traded.
- > Belief movement: Watch collective belief shift in response to breaking news events.

COMMUNITY SIGNAL

The social feed becomes a living dashboard of real-time market-priced opinions.

“ Justify aligns the social graph with the market layer, creating a flywheel of discovery, engagement, and liquidity.

CORE MARKET MECHANICS

SECTION 06 // PROTOCOL LOGIC

Binary Tokenization

Outcomes are represented as **ERC-20 tokens** (YES/NO). Each winning token is redeemable for 1 unit of collateral, ensuring a hard peg to value upon resolution.

AMM Liquidity

An **On-Chain AMM** provides continuous two-sided liquidity. Markets are tradeable from launch without requiring order-book bootstrapping.

Price-Probability Mapping

Prices are quoted in cents of collateral. A price of **\$0.21** directly translates to a **21%** market-implied probability.

Market Equilibrium Example

PROTOCOL ARCHITECTURE: SMART-CONTRACT LAYER

SECTION 07 // TECHNICAL STACK

CONTRACT	CORE ROLE & RESPONSIBILITY
MarketFactory	Deploys and registers markets; single entry point per chain. Handles collateral token configuration.
PredictionMarket	Core logic: question metadata, lifecycle (Open → Closed → Resolved), and settlement execution.
MarketAMM	Constant-liquidity AMM per market; quotes prices and executes Buy/Sell against pooled collateral.
OutcomeToken	ERC-20 representation of outcome positions; minted on buy, burned on redemption/settlement.
OracleResolver	Settlement gateway: authorized resolver calls resolve() based on external truth sources.
FeeTreasury	Centralized per-chain treasury that collects and manages protocol fees from AMM trades.
AccessControl	Role-based management (OpenZeppelin) for factory, resolver, and treasury administrative operations.

⚙️ DESIGN PHILOSOPHY

Justify uses a **modular dependency-injection pattern**. Every external dependency is passed at deployment time, ensuring the core logic remains chain-agnostic.

"The chain is a configuration parameter, not a hard dependency."

Deploying to a new EVM network requires zero code changes—only an artifact registration with local environment variables.

✓ Solidity 0.8.x

🛡️ OpenZeppelin Base

🔗 EVM Compatible

🏭 Factory Pattern

** Implementation leverages immutable core logic with flexible registry patterns to support rapid expansion across L1/L2 networks.*

APPLICATION LAYER & HYBRID ARCHITECTURE

SECTION 08 // TECHNICAL INFRASTRUCTURE

Frontend Stack

High-performance interface with real-time on-chain connectivity and environment-driven chain configuration.

Next.js 14+

TypeScript

Wagmi / Viem

Tailwind CSS

Backend & Social Graph

Manages the social fabric of the protocol, providing low-latency interactions and indexing blockchain state.

NextAuth.js

PostgreSQL

Prisma ORM

Redis Cache

Concern

Implementation Layer

Strategic Rationale

Economics & Trust

ON-CHAIN

- Collateral & Positions
- AMM Price Discovery
- Oracle Settlement

- Trust-minimized custody
- Auditable market odds

Social Engagement

OFF-CHAIN

- Posts, Likes & Shares
- Comments & Threads
- User Profiles & Graph

- Instant performance
- Zero-cost social actions

The Seamless Link: A backend indexer bridges both worlds by mirroring on-chain market state into the social feed. This allows the timeline to render **Live Odds** without forcing every reader through an RPC call, maintaining decentralization where it matters.

MULTI-CHAIN STRATEGY & TARGET NETWORKS

SECTION 09 // PROTOCOL DEPLOYMENT

NETWORK	COLLATERAL	STRATEGIC ROLE
Arc (Circle)	USDC	Stablecoin-native gas and bets; cleanest UX for first production target.
Base	USDC	Social-consumer L2; home for feed-driven trading and active users.
Ethereum	USDC / DAI	Settlement anchor and canonical home for high-value event markets.
Polygon	USDC	Incumbent prediction ecosystem; cheapest entry for retail high-frequency.
BNB Chain	USDC / USDT	Global south retail distribution; capturing high-volume trading communities.

Structural Advantages

Injected Collateral

Factory receives collateral address at deploy; zero code rewrites per chain.

Env-Driven Identity

RPCs, Chain IDs, and explorer links live in environment config, not logic.

Runtime Artifacts

Frontend resolves addresses from served artifacts; one app build fronts all.

Validated Portability

Stack successfully executed substrate swap as pure config-and-redeploy.

BRIDGE-PROXIED MARKETS: THE UNIFICATION PHASE

• PHASE 3 ARCHITECTURE

SECTION 10 // CROSS-CHAIN INFRASTRUCTURE

PHASE 2: CURRENT STATE

The Liquidity Fragmentation Problem

Isolated Pools: Capital on Base cannot trade against markets on Polygon.

Divergent Odds: Same event, different prices across chains due to thin order books.

Operational Bloat: Creators must choose one network, excluding all other capital.

PHASE 3: THE TARGET

One Pool. One Price. Global Access.

HOME MARKET (ARC)

Unified AMM & Collateral (USDC)

PROXY: BASE

PROXY: POLYGON

PROXY: BSC

⚡ Unified Liquidity

Every chain's users deepen the same book; big-chain depth from day one.

🛡️ Source of Truth

One resolution event settles all chains; no proxy can disagree with home state.

⚡ Local-First Routing

If market is on user's chain, proxy path is bypassed for native speed.

⚙️ Bridge-Agnostic

Supports CCIP, CCTP, and L0. The bridge is a config, not a commitment.

PROGRESSIVE ORACLE RESOLUTION

SECTION 11 // SETTLEMENT ROADMAP

PHASE 1: MVP

Authorized Manual

Centralized yet transparent resolution where authorized resolvers settle markets based on committed public evidence.

MECHANISM

Role-based resolve() call

COMMITMENT

Oracle-proof URL at creation

PHASE 2: AUTOMATION

Verifiable Workflows

Automating resolution for objectively verifiable events using off-chain compute to fetch and verify data sources.

INTEGRATION

Chainlink CRE / Custom Adapters

PROCESS

Automated source verification

PHASE 3: NETWORK

Decentralized Unified

Cross-chain propagation where resolution on the home chain settles all global proxy markets simultaneously.

PROPAGATION

Bridge-based state sync

GOVERNANCE

Protocol-wide consensus

● Current Status: Phase 1 (Arc Testnet Live)

● Target: Full Phase 3 Unification (Q4 2026)

FEES AND ECONOMIC SUSTAINABILITY

SECTION 12 // ECONOMIC MODEL

Protocol Revenue Streams

- > **AMM Protocol Fees:** Collected on every trade (Buy/Sell) against the on-chain liquidity pool.
- > **Unification Surcharge:** Bridged orders carry home-market fees plus transport cost, surfaced at intent time.
- > **Redemption Spreads:** Minimal processing fee applied during final settlement of winning outcome tokens.

Economic Integrity

Justify avoids synthetic inflationary risks by using **canonical collateral** (USDC/DAI). Sustainability is driven by volume, not token emissions.

REAL COLLATERAL ONLY

NON-INFLATIONARY

The Creator-Economy Loop

Justify aligns social distribution with market volume by directing a **configurable share** of market fees to creators.

- ✓ **Incentivized Accuracy:** Reputation accrues to creators with high volume and high-quality resolution proofs.
- ✓ **Distribution as Value:** Unlike listing pages, Justify rewards the social graph that drives the discovery.

Long-term Sustainability: Fee flows are routed to per-chain **FeeTreasury** contracts, managed via protocol governance for scaling and R&D.

SECURITY MODEL & RISK MITIGATION

SECTION 13 // PROTOCOL SAFETY FRAMEWORK

Contract Integrity

- **MODULAR ARCHITECTURE**

OpenZeppelin primitives with injected-dependency pattern. No monolithic "god-contracts."

- **ACCESS CONTROL**

Granular Role-Based Access Control (RBAC) for factory, resolver, and treasury functions.

- **IMMUTABLE MARKETS**

Market logic is non-upgradeable. Critical parameters are fixed at deployment to prevent rug-pulls.

Economic Stability

- **CANONICAL ASSETS**

Only chain-native stablecoins (USDC/DAI) accepted. No protocol-issued synthetic collateral.

- **SOLVENCY GUARANTEE**

AMM pools are 100% collateralized. Outcome tokens are minted only against locked assets.

- **LIQUIDITY PROTECTION**

Standardized fee distribution ensures continuous AMM depth and creator incentive alignment.

Bridge Resilience

- **CIRCUIT BREAKERS**

Ability to pause new proxy intents on anomaly detection without blocking user redemptions.

- **EXPOSURE CAPS**

Per-route liquidity limits to contain potential bridge failures and minimize blast radius.

- **ADAPTER ISOLATION**

Bridge-agnostic IBridgeAdapter interface allowlists specific providers (CCIP, CCTP, etc.).

ORACLE PROOF

Every market requires a **Public Resolution Commitment** at creation. Oracle-proof URLs ensure transparency, allowing any user to verify resolution criteria against the source of truth before placing trades.

STRATEGIC ROADMAP

SECTION 14 // EXECUTION PATH

* Timeline estimates are subject to network stability and bridge infrastructure audits. Current focus: Arc Testnet stability.

| CONCLUSION: THE FUTURE OF SOCIAL TRADING

SECTION 15 // FINAL VISION

01

ONE QUESTION

The market is the **social object**. By embedding event markets directly into social feeds, Justify collapses the distance between discourse and action, transforming opinions into tradeable signals.

02

ONE POOL

Liquidity is infrastructure. Through **bridge-proxied architecture**, Justify unifies fragmented capital across every supported chain, ensuring every market has the depth of a global venue.

03

ONE PRICE

The chain is a detail. Delivering a **single source of truth** across Arc, Base, Ethereum, Polygon, and BSC, meeting users exactly where their capital already lives with zero friction.

TRADE SMARTER, TOGETHER.
